Theory X, Y, and Z in business management

Cobán Alta Verapaz, Guatemala, March 2023

INTRODUCTION:

The existing administrative philosophy and the resulting practices have a definitive impact on how the organization functions. According to this theorist, the administration must start with a basic question: how do they look self-managers in relation to others. This perspective requires a little reflection on the perception of human nature. Theory X and the Theory Y consists of two groups of assumptions about it. McGregor selects these terms because I wanted neutral terminology without connotations of being "good" or "bad".

The purpose of this work is to introduce the theories of the administered called x, y, z; which are implemented to obtain results of effectiveness and success in administration. These theories can be focused on all types of organization as well as school administration.

Within the content of this research, each theory will be examined along with its exponents, their main ideas and how it can be applied in the administration

GENERAL OBJECTIVES:

- Diagnose each of the researched theories.
- Evaluate and analyze these theories.
- Specify the use of it, developing in which areas it can be used.

SPECIFIC OBJECTIVES:

- Compare each theory in the different areas.
- Demonstrate that it is used in daily life.
- Identify the pros and cons of each one.

The X, Y, Z Theory of Management:

Theory X:

McGregor, one of the most famous theorists of the behavior approach in the administration was concerned with comparing two antagonistic styles of management: a style based on traditional theory, excessively mechanistic and pragmatic (which he called theory X), and another style that will be presented later. This theory known as Theory X formulated by Professor Douglas McGregor of the School of Industrial Management at the Massachusetts Institute of Technology, American psychologist and Harvard professor, this researcher studied the effects of the Great Depression of the 1920s and the recession of the 1930s United States.

- This theory tends to classify the individual as irresponsible and that for so it needs close supervision.

According to McGregor, the 'traditional' assumptions about human nature are included in Theory X. The assumptions and beliefs of this theory still they determine the human aspect of many organizations in which it is believed that the people tend to behave according to the expectations of theory X:

- With negligence,
- passivity
- resistance to change
- lack of responsibility
- tendency to believe in demagoguery,
- demands for economic benefits, etc.

Thus McGregor, this behavior is not the cause, but the effect of something negative experience in an organization.

Theory X compared to other theories by McGregor emphasizes on various assumptions within activities such as administrative control and the direction of the organization's activities. In this way, this theory places emphasis on the administration has the primary responsibility to organize and direct resources human, material, and financial resources of the organization directed towards its objectives.

Assume that people are passive and resist the needs of the organization and She must, therefore, be persuaded, rewarded, or punished, depending on the case. people, according to this point of view, lacks initiative, is egocentric and opposes the change.

Theory Y:

Like in Theory X, Douglas McGregor is the creator of this theory. In this the model its author establishes that people can apply themselves to work with as much naturalness as they would in play or during rest; that is to say, people can self-regulate their work; thus, the normal person tries to assume responsibilities; insofar as creativity, ingenuity, and imagination are something that the the majority of human beings have and can develop, and not just a few. McGregor called this set of beliefs Theory Y.

McGregor recommends a series of innovative and fully focused ideas. towards the application of theory Y:

- Decentralization and delegation: It is to delegate decisions to the levels lower levels of the organization to allow all people to involve in activities.
- **Extension of the major significance of work: The reorganization** they provoke innovation and stimulate the acceptance of responsibility in the organization, in addition to satisfying social needs and self-esteem.
- **Participation and consultative management: This gives people** opportunities to meet social and self-esteem needs.
- Self-assessment of performance: A superior exercises leadership and... will focus on guiding and stimulating future performance and not judging the past performance. With this, the person seems more motivated to acquire greater responsibility in planning and contributes to the objectives of the organization, which is positive in the needs of esteem and of self-actualization.

Theory Y proposes a highly participative management style and democratic, based on human and social values; this theory is a management by objectives that enhances individual initiative.
McGregor describes a Theory Y model in practice, which he called 'plan' Scanlon's bases rest on the fact that management generates participation from your employees in cost reduction programs, sharing the benefits from joint effort. In this model, the employee achieves their personal development applying to the fullest extent their capabilities, in an environment of cooperation and equity which rewards their contribution. The organizational climate created by the manager, who beyond their personality or leadership style, must convey integrity and consistency with a set of principles in which respect for the being human is a priority issue.
Administration is characterized by motivation, the potential for development, ability to assume responsibilities and direct behavior towards the
The objectives of the company are factors in people. They are not created by the administration, whose responsibility is limited to providing conditions for that people recognize and develop such factors by themselves.

Theory Z:

Also called the 'Japanese method', it is a management theory developed by William Ouchi and Richard Pascale (collaborator), who, like McGregor to the They verified their theory Y and contrasted it with a theory X and a 'theory A'. The theory Z Ouchi arises when studying this author the differences between management of the North American companies and Japanese companies.

Ouchi firmly believes that a job is more than that, it is the structural part. of the employees' lives, it is what allows them to live where they live, eat what they eat, wear what they wear, define their old age, etc. So, if this job is developed completely within an organization, the person integrates into she and creates a sense of belonging that leads her to give everything possible for

achieve business goals, whereby productivity would be practically assured. At the working group level, with trust it they reinforce those qualities in ways that remind us of the conception of the the working group dynamics proposed by Mayo. But, according to Ouchi, the framework The broader clan is essential for the efficiency of the work team.

Ouchi states that some highly successful North American companies have done exactly that, they have produced the same series of conditions and effects as occurred in Japan. This development indicates that Americans do not need imitate the administrative methods of Japan. This teamwork and this sense Belonging enables an involvement and commitment to the company. that strengthen continuous improvement (this management model was implemented in Japan thanks to the teachings of William Edwards Deming.

The 'Z Theory' requires a period of knowledge, reflection, and finally, acceptance of their ideas. When the response is positive, the process of begins implementation of the principles, procedures, and systems of the theory to the daily practice in the organization.

This application affects not only the administrative aspect but also the organization. embargo, the most important and decisive thing lies in that, at all levels, from the the summit of the Management, down to the last pawn, the spirit and philosophy 'Z' permeate and Encourage the thoughts and activities of all members. It deserves a section. especially the management team, who must be the first, in time and in intensity, in being convinced of the necessity and qualities of the 'Theory Its application seriously compromises the organization that accepts them. the following levels also need that strong imprint of Philosophy and Theory "Z", until this phenomenon of "osmosis", of absorption, has not occurred produced at a sufficient level, the practical application runs serious risks of to fail

The application of methods such as work and task improvements, methods of motivation, organizational change, are approaches within the control circles that play a very important role within the style of leadership. The members of These circles meet once a week to discuss aspects of their work. which allows them to participate in making their own decisions. Therefore, Teamwork is one of the aspects that favor the modern director.

Which of the 3 theories is better and why?

Each of the theories is used in different work areas, I believe.
Depending on the area we find ourselves in, they will be used.

- if we are in an audit, the X would be used,
  Why? For the simple reason that rules and processes must be followed, in this way this theory places in management the main responsibility to organize and direct resources humans, materials and financial resources.

- in a company where there are goals to achieve objectives, one I would use the Y, why? The same situation, the leader must have consider the ideas of the employees themselves to solve the strategically needs with the common good for all, where it The leader has full confidence in the brilliance of their human resources.

- It focuses more on never changing in the workplace where it takes. use of Z why? Since according to studies conducted in 1981, leaders think that their employees are loyal and open, which it involves being participative and teamwork, a clear example is soccer.

2. **Which is more applied in companies?**

All three theories can be applied, but I believe the most commonly used in companies is. theory Y, but I stick with theory Z, since we are all one and one we are everything, or how are we doing team, etc.. it depends on what we don't want to face and our objectives.

3. **Perform an analysis of each one.**

1= it is used in tasks where processes, discipline, and obedience are required orders to not fail in the mandates. This would be used in the military, or companies that only require goals.

2= used where human resources are listened to and vice versa in order to to carry hand in hand the objectives and the resolution of the objectives by resolving thus the needs, where the leader inspires and gives his trust to reach the goals and being better day by day.

We work in both ways, either x or y, in order to be good as a team.
where the leader places trust in their employees and expects loyalty

results, thus providing support to the best or the best employees and encourage day by day.

CONCLUSION:

Since ancient times, man has tried to study behavior. of man, in order to control factors that intervene in productivity and effectiveness of their work and way of life. In this way, many philosophers, mathematicians, sociologists and other personalities have created theories that attempt to give an explanation when comparing effectiveness, needs, and productivity to work level.

This group of theories researched in the work content has resulted in pillars of human behavior within their responsibilities and tasks within an organization. Theory X and Theory Y, proposed by the same author Douglas McGregor, while the Z theory proposed by William Ouchi.

Theory X focused on human behavior, while Theory Y focuses on the employer's motivation strategies for their greater performance and Theory Z consider that employees should have a participatory role within the company as an integrating organization.

These theories oppose each other, focusing on different aspects, giving different approaches and applications. In this way, the philosophies managerial practices adopted, whether explicitly or implicitly, can lead to different organizations. Equivalently, the manager will design an organization with a decision center at the summit, according to the philosophy that has been adopted, and so on will implement and spread among the members of the organization with the same purposes to achieve the desired results as a team.
